                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                          Score

The polypeptides a its fragments (see also AAW09015-17) lack the light chain and HN epitopes necessary for metalloprotease activity and toxin internalisation. They are free of botulinum toxin activity but c induce protective immunity to a type F botulinum toxin, making the useful for vaccine prodn. Recombinant polypeptides can be produced in transformed host cells, esp. as fusion proteins, e.g. with maltose binding protein to facilitate purification.
                                                 Synthetic.

                                                                                                                                                                                                                                                                                                                                                         chain and then posttranslationally nicked, forming a dichain consisting of a 100 kpa heavy chain and a 50 kpa light chain which cremain linked by a disulfide bond. Nucleic acids encoding the carboxy-terminal (HC) or amino-terminal (HN) portion of the heavy chain of botulinum neurotoxin (BoNT) can be used in recombinant cexpressed in transformed cells to produce peptide antigens useful for eliciting an immune response to give peptide antigens useful for eliciting an immune response to give peptide immunity against botulinum neurotoxin, which causes to botulism. The nucleic acids are expressible in a recombinant organisms such as Escherichia coli or Pichla pastoris. The use of recombinant nucleic acids are advantageous since it eliminates the need to culture large quantities of hazardous toxin-producting bacterium. Production yield from the genetically engineered product is also high and cost of production is lower. The nucleic acids can
                                                                                                                                                                                                                                                                                                 Query Match

                                                                                                                                                    Botulism neurotoxins are translated as a single 150 kDa polypeptide C chain and then posttranslationally nicked, forming a dichain C consisting of a 100 kDa heavy chain and a 50 kDa light chain which remain linked by a disulfide bond. Nucleic acids encoding the carboxy-terminal (HC) or amino-terminal (HN) portion of the heavy chain of botulinum neurotoxin (BONT) can be used in recombinant expression vectors and expressed in transformed cells to produce peptide antigens useful for eliciting an immune response to give protective immunity against botulinum neurotoxin, which causes botulism. The nucleic acids are expressible in a recombinant organisms such as Escherichia coli or Pichia pastoris. The use of recombinant nucleic acids are advantageous since it eliminates the need to culture large quantities of hazardous toxin-producing bacterium. Production yield from the genetically engineered product is also high and cost of production is lower. The nucleic acids can be derived from clostridium botulinum serotypes A-G.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            CC The invention relates to a non toxic polypeptide, for delivery of a CC therapeutic agent to a neuronal cell, which comprises a binding domain CC (carboxy terminal half of heavy chain (HC) of a neurotoxin, designated CC as Hc) that binds to the neuronal cell and a translocation domain (amino CC terminal half of HC, designated as HN), that translocation domain is not a HN CC domain of a clostridial neurotoxin and is not a fragment or derivative of CC a HN domain of a clostridial toxin. Polypeptides of the invention are CC useful for the treatment of a disease state associated with neuronal CC cells. The polypeptide constructs are useful for delivering therapeutic CC substances to neuronal cells. They are useful to treat disorders of the CC Sincluding neurodegenerative diseases, stroke, epilepsy, brain tumours CC and infection. They are also useful in gene therapy. The present sequence is modified clostridial heavy chain fragment. This sequence is CC constructed by fusing the binding domain of botulinum neurotoxin type F CC (BoNT/F) with translocation domain of diphtheria neurotoxin.

                                                                                                                                                          CC The invention relates to a non toxic polypeptide, for delivery of a CC therapeutic agent to a neuronal cell, which comprises a binding domain CC (carboxy terminal half of heavy chain (HC) of a neurotoxin, designated CC as HC) that binds to the neuronal cell and a translocation domain (amino CC terminal half of HC, designated as HN), that translocation domain (amino CC terminal half of HC, designated as HN), that translocation domain is not a HN domain of a clostridial neurotoxin and is not a fragment or derivative of CC all N domain of a clostridial toxin. Polypeptides of the invention are CC useful for the treatment of a disease state associated with neuronal CC cells. The polypeptide constructs are useful for delivering therapeutic CC substances to neuronal cells. They are useful to treat disorders of the CC substances to neuronal cells. They are useful to treat of the CC and infection. They are also useful in gene therapy. The present sequence CC is modified clostridial heavy chain-superoxide dismutase conjugate. This CC conjugate comprises bacterial Mn-superoxide dismutase (MnSOD), from Bacillus stearothermophilus, linker that can be cleaved by factor Xa, CC chiadra for the from influenza virus and a neuronal cell-specific

The invention relates to a non toxic polypeptide, for delivery of a CC therapeutic agent to a neuronal cell, which comprises a binding domain CC (carboxy terminal half of heavy chain (HC) of a neurotoxin, designated CC as Hc) that binds to the neuronal cell and a translocation domain (amino CC terminal half of HC, designated as HN), that translocation domain is not a HN CC domain of a clostridial neurotoxin and is not a fragment or derivative of CC agent into the neuronal cell, where the translocation domain is not a HN CC domain of a clostridial toxin. Polypeptides of the invention are CC useful for the treatment of a disease state associated with neuronal CC cells. The polypeptide constructs are useful for delivering therapeutic CC substances to neuronal cells. They are useful to treat disorders of the CC and infection. They are also useful in gene therapy. The present sequence CC is modified clostridial heavy chain-superoxide dismutase conjugate. This conjugate comprises bacterial Mn-superoxide dismutase (MnSOD), from CC Bacillus Stearothermophilus, linker that can be cleaved by factor Xa, CC specific binding domain from botulinum neurotoxin and a neuronal cell.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Chimeric - Bacillus stearothermophilus

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to a non toxic polypeptide, for delivery of a CC therapeutic agent to a neuronal cell, which comprises a binding domain CC (carboxy terminal half of heavy chain (HC) of a neurotoxin, designated CC as HC) that binds to the neuronal cell and a translocation domain (amino terminal half of HC, designated as HN), that translocation domain (amino terminal half of HC, designated as HN), that translocates the therapeutic CC agent into the neuronal cell, where the translocation domain is not a HN CC domain of a clostridial neurotoxin and is not a fragment or derivative of CC a HN domain of a clostridial toxin. Polypeptides of the invention are CC useful for the treatment of a disease state associated with neuronal CC cells. The polypeptide constructs are useful for delivering therapeutic CC cubstances to neuronal cells. They are useful to treat disorders of the CC (NS including neurodegenerative diseases, stroke, epilepsy, brain tumours and infection. They are also useful in gene therapy. The present sequence is modified clostridial heavy chain-superoxide dismutase conjugate.

CC Inker that can be cleaved by thrombin, translocation domain from CC diphtheria neurotoxin and a neuronal cell-specific binding domain from CC botulinum neurotoxin type F (BONT/F).

                                                                                                                                                                                   The invention relates to a non toxic polypeptide, for delivery of a therapeutic agent to a neuronal cell, which comprises a binding domain (carboxy terminal half of heavy chain (HC) of a neurotoxin, designated as HC) that binds to the neuronal cell and a translocation domain (amino terminal half of HC, designated as HN), that translocates the therapeutic agent into the neuronal cell, where the translocation domain is not a HN domain of a clostridial neurotoxin and is not a fragment or derivative of a HN domain of a clostridial toxin. Polypeptides of the invention are useful for the treatment of a disease state associated with neuronal cells. The polypeptide constructs are useful for delivering therapeutic substances to neuronal cells. They are useful to treat disorders of the
                                                                                                                        CNS including neurodegenerative diseases, stroke, epilepsy, brain tumours and infection. They are also useful in gene therapy. The present sequence is C. botulinum C2 enterotoxin translocation domain with botulinum neurotoxin type F (BONT/F) binding domain used in the exemplification of
                                                                                                                                                                                                                                                                                                                                                                                                           New non toxic polypeptide for delivery of a therapeutic agent treatment of a CNS disorder comprising a binding domain that translocates the therapeutic agent into the neuronal cells - \frac{1}{2}
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       02-DEC-1999;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Qy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     В
                                       Query Match
                                                                                                                 The present sequence represents a construct of the invention, comprising a manganese superoxide dismutase (Mn-SOD) polypeptide, a linker that can be cleaved by thrombin, and a heavy chain derived from botulinum neurotoxin serotype F. The specification describes a composition for delivery of SOD to neuronal cells. The composition comprises SOD linked, by a cleavable linker, to a neuronal cell targeting component (NCTC). This component has a domain that binds to a neuronal cell and a domain that translocates the SOD of the composition into the neuronal cell. After translocates the SOD of the composition into the neuronal cell. After translocation, the linker is cleaved to release the SOD. The composition is useful for treating neuronal diseases caused or augmented by oxidative stress, such as ischemic stroke, trauma, Parkinson's disease, Huntington's disease and motor neurone diseases.
                                                                                                                                                                                                                                                                                                                                                                               Novel composition, comprising superoxide dismutase linked by a cleavable linker to a neuronal cell targeting component useful for delivering superoxide dismutase to neuronal cells to treat ischemia -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Manganese superoxide dismutase; Mn-SOD; SOD; neuronal cell; neuronal cell targeting component; NCTC; neuronal disease; oxidative stress; ischemic stroke; trauma; parkinson's disease; muntington's disease; motor neurone disease;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          B 8
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present sequence represents a construct of the invention, comprising a mitochondrial leader sequence from human manganese superoxide dismutase (Mn-SOD), a Bacillus stearothermophilus Mn-SOD, a linker that can be cleaved by thrombin, and a heavy chain derived from botulinum neurotoxin serotype F. The specification describes a composition for delivery of SOD to neuronal cells. The composition comprises SOD linked, by a cleavable linker, to a neuronal cell targeting component (NCTC). This component has a domain that binds to a neuronal cell and a domain that translocates the SOD of the composition into the neuronal cell. After translocation, the linker is cleaved to release the SOD. The composition is useful for treating component and the composition is cleaved to release the SOD. The composition is sufficiently sufficiently

CC The invention relates to a non toxic polypeptide, for delivery of a CC therapeutic agent to a neuronal cell, which comprises a binding domain CC (carboxy terminal half of heavy chain (HC) of a neurotoxin, designated CC as HC) that binds to the neuronal cell and a translocation domain (amino CC terminal half of HC, designated as HN), that translocates the therapeutic CC agent into the neuronal cell, where the translocation domain is not a HN CC domain of a clostridial neurotoxin and is not a fragment or derivative of CC and in of a clostridial toxin. Polypeptides of the invention are CC useful for the treatment of a disease state associated with neuronal CC cells. The polypeptide constructs are useful for delivering therapeutic CC substances to neuronal cells. They are useful for delivering therapeutic CC including neurodegenerative diseases, stroke, epilepsy, brain tumours and infection. They are also useful in gene therapy. The present sequence is C. botulinum C2 enterotoxin translocation domain with botulinum creation of the construction of the

                                                                                                                                                                                             The invention relates to a non toxic polypeptide, for delivery of a C therapeutic agent to a neuronal cell, which comprises a binding domain CC (carboxy terminal half of heavy chain (HC) of a neurotoxin, designated CC as Hc) that binds to the neuronal cell and a translocation domain (amino CC terminal half of HC, designated as HN), that translocates the therapeuttic agent into the neuronal cell, where the translocates the therapeuttic CC agent into the neuronal cell, where the translocation domain is not a HN CC domain of a clostridial neurotoxin and is not a fragment or derivative of CC domain of a clostridial toxin. Polypeptides of the invention are useful for the treatment of a disease state associated with neuronal CC cells. The polypeptide constructs are useful for delivering therapeutic CC substances to neuronal cells. They are useful to treat disorders of the CCNS including neurodegenerative diseases, stroke, epilepsy, brain tumours CC and infection. They are also useful in gene therapy. The present sequence CC constructed by fusing the binding domain which is a hybrid of botulinum CC neurotoxin type F (BoWFF) and tetanus neurotoxin (TeNT) domain II with CC translocation domain of diphtheria neurotoxin.
                                                                              Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New non toxic polypeptide for delivery of a therapeutic agent for the treatment of a CNS disorder comprising a binding domain that translocates the therapeutic agent into the neuronal cells \cdot
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Chimeric - Clostridium tetani.
Chimeric - Clostridium botulinum

The invention relates to novel vaccines that induce a protective immune CC cresponse against botulinum neurotoxin (BoNT) serotypes A, B, C, D, E, F CC and G (BoNTA-BONTG). The vaccine of the invention is novel recombinant CC in the comprising a c-terminal heavy chain fragment (Hc) from BoNT CC fragment comprising a c-terminal heavy chain fragment (Hc) from BoNT CC serotypes A-G. In preferred embodiments of the invention, the vector is call venezuelan equine encephalitis virus (VEB) replicon vector. Use of this vector results in the production of large amounts of a protein encoded by a sequence cloned into the replicon. The constructs are used to produce vaccines against botulism. The proteins can also be used as collapsostic tools for the diagnosis of botulism. The transformed host collapsostic tools for the diagnosis of botulism. The transformed host collaps can be used to analyse the effectiveness of drugs and agents which collapse can be used to analyse the effectiveness of drugs and agents which collapse collapsost of the vaccine currently used against botulism is can also be used to analyse the effectiveness of drugs and agents which collapse collapsost of the vaccine formulation. The novel collapsost of the recipient. Also, the vaccine is incomplete, in that only collapsost collapso
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Claim 27; Page -; 54pp; English.

                                 Novel polypeptides (AAW09014-17) respectively comprise amino acids 848-1278, 848-991, 992-1135 and 1136-1278 in the heavy chain of a type F botulinum neurotoxin (BOMT/F). They lack the L chain and HN epitopes necessary for metalloprotease activity and toxin internalisation. They are free of botulinum toxin activity but can induce protective immunity to a type F botulinum toxin, making them useful for vaccine prodn. Recombinant polypeptides can be produced in transformed host cells, esp. as fusion proteins, e.g.

                                                                                Novel polypeptides (AAW09014-17) respectively comprise amino acids 848-1278, 848-991, 992-1135 and 1136-1278 in the heavy chain of a type F botulinum neurotoxin (BONT/F). They lack the L chain and HN epitopes necessary for metalloprotease activity and toxin internalisation. They are free of botulinum toxin activity but can induce protective immunity to a type F botulinum toxin, making them useful for vaccine produ. Recombinant polypeptides can be produced in transformed host cells, esp. as fusion proteins, e.g. with maltose binding protein to facilitate purification.

The polypeptides and its fragments (see also AAW09015-17) lack the light chain and HN epitopes necessary for metalloprotease activity and toxin internalisation. They are free of botulinum toxin activity but can induce protective immunity to a type F botulinum toxin, making them useful for vaccine prodn. Recombinant polypeptides can be produced in transformed host cells, esp. as fusion proteins, e.g. with maltose binding protein to facilitate purification.

                                                                                                                                                                                                                                                                                                                                                                                                                                     expression vectors and expressed in transformed cells to produce peptide antigens useful for eliciting an immune response to give protective immunity against botulinum neurotoxin, which causes botulism. The nucleic acids are expressible in a recombinant organisms such as Escherichia coli or Pichia pastoris. The use of recombinant nucleic acids are advantageous since it eliminates the need to culture large quantities of hazardous toxin-producing bacterium. Production yield from the genetically engineered products also high and cost of production is lower. The nucleic acids ce be derived from Clostridium botulinum serotypes A-G.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Botulism neurotoxins are translated as a single 150 kDa polypeptide chain and then posttranslationally nicked, forming a dichain consisting of a 100 kDa heavy chain and a 50 kDa light chain which remain linked by a disulfide bond. Nucleic acids encoding the carboxy-terminal (HC) or amino-terminal (HN) portion of the heavy chain of botulinum neurotoxin (BoNT) can be used in recombinant
                                                                                                                                                                                                                                                                                                                                                                                                               Sequence

                                                                                                                                                                Botulism neurotoxins are translated as a single 150 kDa polypeptide chain and then posttranslateionally nicked, forming a dichain consisting of a 100 kDa heavy chain and a 50 kDa light chain which remain linked by a disulfide bond. Nucleic acids encoding the carboxy-terminal (HC) or amino-terminal (HN) portion of the heavy chain and expression vectors and expressed in transformed cells to produce peptide antigens useful for eliciting an immune response to give protective immunity against botulinum neurotoxin, which causes botulism. The nucleic acids are expressible in a recombinant corpanisms such as Escherichia coll or Pichia pastoris. The use of recombinant nucleic acids are expressible in a recombinant to read to culture large quantities of hazardous toxin-producing bacterium. Production yield from the genetically engineered product is also high and cost of production is lower. The nucleic acids can be derived from Clostridium botulinum serotypes A-G.

Polypeptides of the invention are CC useful for the treatment of a disease state associated with neuronal CC cells. The polypeptide constructs are useful for delivering therapeutic CC substances to neuronal cells. They are useful to treat disorders of the CC substances to neuronal cells. They are useful to treat disorders of the CC is modified clostridial heavy chain fragment. This sequence is CC constructed by fusing the binding domain of botulinum neurotoxin type F CC (BONT/F) with translocation domain of diphtheria neurotoxin.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Matches 431;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to a non toxic polypeptide, for delivery of a C therapeutic agent to a neuronal cell, which comprises a binding domain CC (carboxy terminal half of heavy chain (HC) of a neurotoxin, designated as HC) that binds to the neuronal cell and a translocation domain (amino C terminal half of HC, designated as HN), that translocates the therapeutic agent into the neuronal cell, where the translocation domain is not a HN comain of a clostridial neurotoxin and is not a fragment or derivative of a HN domain of a clostridial toxin. Polypeptides of the invention are cuseful for the treatment of a disease state associated with neuronal cells. The polypeptide constructs are useful for delivering therapeutic cells. The polypeptide constructs are useful to treat disorders of the C construction of a clostridial neuronal cells. They are useful to treat disorders of the constructs are useful for delivering therapeutic constructs in including neurodegenerative diseases, stroke, epilepsy, brain tumours and infection. They are also useful in gene therapy. The present sequence is modified clostridial heavy chain-superoxide dismutase conjugate. This conjugate comprises bacterial Mn-superoxide dismutase (MnSOD), from a conjugate comprises bacterial Mn-superoxide dismutase (MnSOD), from the conjugate comprises bacterial Mn-superoxide dismutase (MnSOD), from the conjugate of the conjugate conjugate conjugate of the conjugate conj

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                QY
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            В
밁
                             The invention relates to a non toxic polypeptide, for delivery of a C therapeutic agent to a neuronal cell, which comprises a binding domain CC (carboxy terminal half of heavy chain (HC) of a neurotoxin, designated CC as He) that binds to the neuronal cell and a translocation domain (amino CC terminal half of HC, designated as HN), that translocation domain (amino CC domain of a clostridial neurotoxin and is not a fragment or derivative of CC agent into the neuronal cell, where the translocation domain is not a HN (compain of a clostridial neurotoxin and is not a fragment or derivative of CC als. The polypeptide constructs are useful for the treatment of a disease state associated with neuronal CC cells. The polypeptide constructs are useful for delivering therapeutic CC substances to neuronal cells. They are useful to treat disorders of the CC and infection. They are also useful in gene therapy. The present sequence CC is modified clostridial heavy chain-superoxide dismutase conjugate. This conjugate comprises bacterial Mn-superoxide dismutase conjugate. This conjugate comprises bacterial Mn-superoxide dismutase (MnSOD), from CC Bacillus stearothermophilus, linker that can be cleaved by factor Xa, CC specific binding domain from diphtheria neurotoxin and a neuronal cell-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New non toxic polypeptide for delivery of a therapeutic agent for the treatment of a CNS disorder comprising a binding domain that translocates the therapeutic agent into the neuronal cells .
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Chimeric - Bacillus stearothermophilus.
Chimeric - Corynebacterium diphtheriae.
Chimeric - Clostridium botulinum.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Neuronal cell; binding domain; translocation domain; stroke; epilepsy; tumour; infection; neurodegenerative disease; gene therapy; chimeric; superoxide dismutase; SOD; diphtheria neurotoxin; botulinum neurotoxin type F; BONT/F.
